AUTOMATIC WORKOUT TRACKING

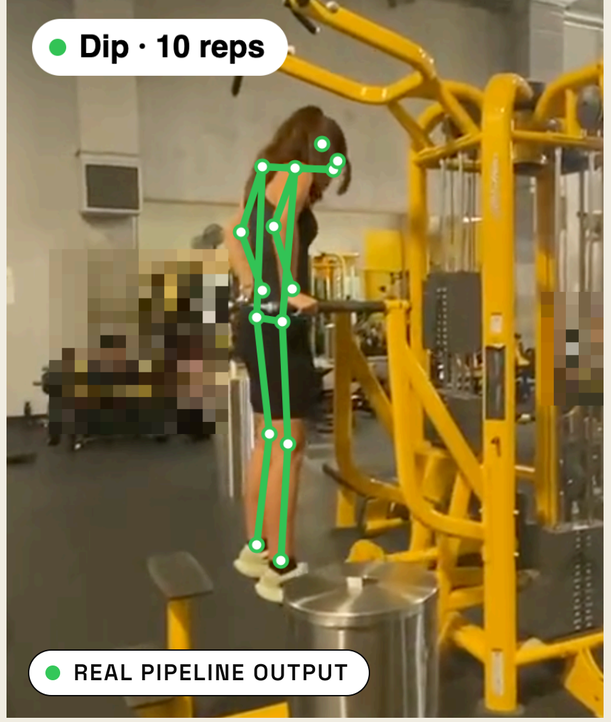

spottr

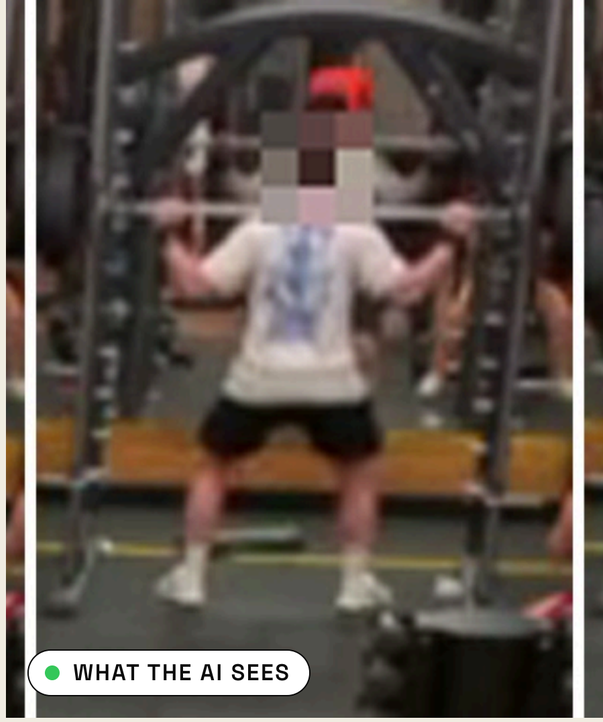

Spottr turns the cameras a gym already has into automatic workout logs for members and floor data for the gym.

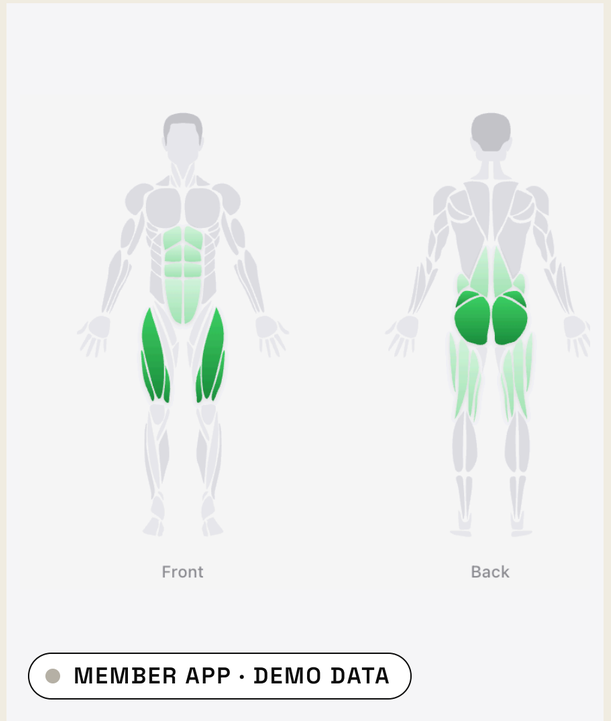

Live demo · tryspottr.app/demo

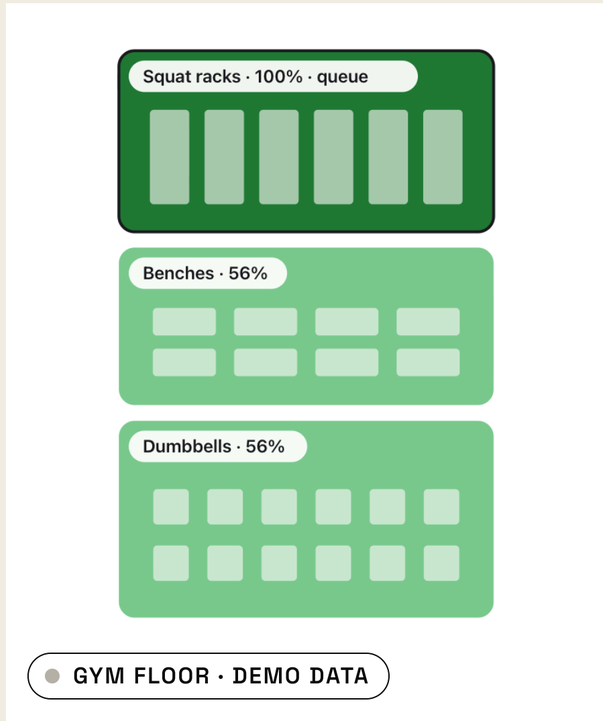

Felix Müller-Gliemann · Martin · Gard, co-founders
info@tryspottr.app · October 2026

[TODO: full names of Martin and Gard]

GYM CAMERAS ALREADY FILM THE FLOOR. NOBODY COUNTS THE REPS.

MEMBERS

Nobody types between sets.

● FOUNDER OBSERVATION

GYMS

No data on how their floor is used, and a third of members leave each year.

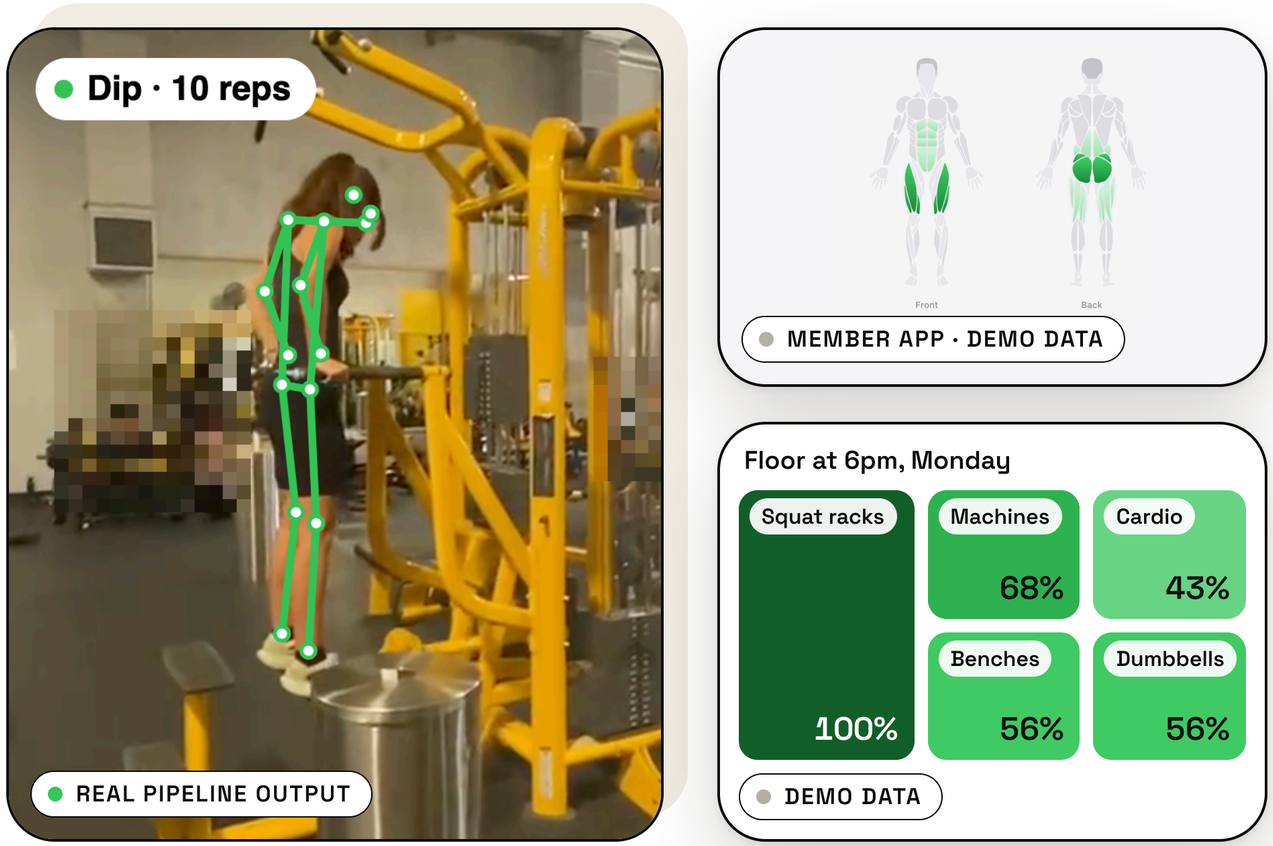

[TODO: one verbatim, approved quote from a gym operator, with name and gym (HC1)]

Gyms: average annual retention 66.4% (HFA 2025 Benchmarking, 175 operators, data year 2024). Members: founder observations, not a survey.

Solution · the gym pays, members use it

Members get every set logged. Gyms see their floor, hour by hour.

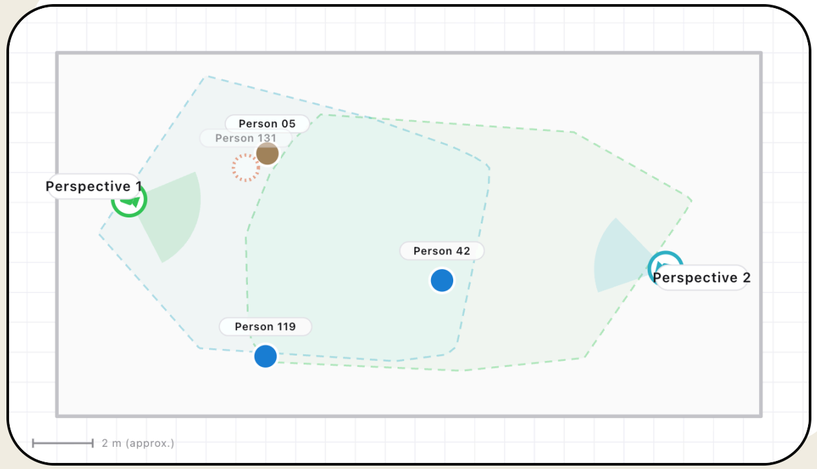

BUILT Body pose, not faces. Detected bystanders are pixelated in the replay.

Replay: recorded dip clip, lifter's consent confirmed; keypoints and rep count are the pipeline's output; background people pixelated. Member app and floor: the demo's simulated gym. Gym dashboards are simulated today.

How it works

Designed to plug in: one box and the cameras a gym already has.

REAL OUTPUT

Two recorded phones, one shared map. A test room, not a gym.

Joins the gym's network

Same method for every lift

One blurred image per set

Gym cameras — LIVE FEED: BUILDING

Spottr box — BUILDING

Pose → reps — BUILT
on squats, dips

Snapshot → lift — BUILT

App + dashboard — BUILT · GYM DATA SIMULATED

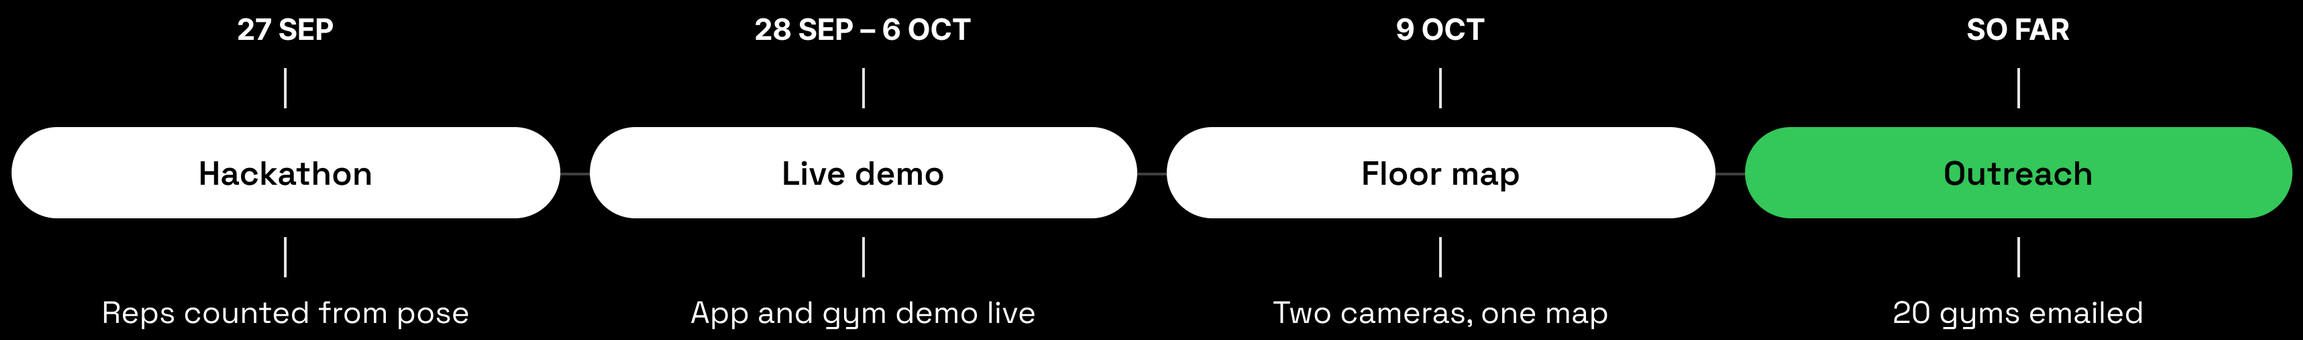

Today the pipeline runs on recorded footage; live camera ingestion and the box are in development. Map: world-service output, each person kept as one anonymous identity across both views (world-service/docs/REPORT.md).

Progress

8 OF 20 GYMS REPLIED. ONE CHAIN IS IN PILOT TALKS.

● FOUNDER-REPORTED Multi-location San Francisco chain: location GM positive, corporate sign-off pending.

[TODO (OC1): with a signed pilot, LOI or corporate email: "An [N]-location San Francisco chain starts a pilot with us on [date]." + logo with permission; then make this slide 4]

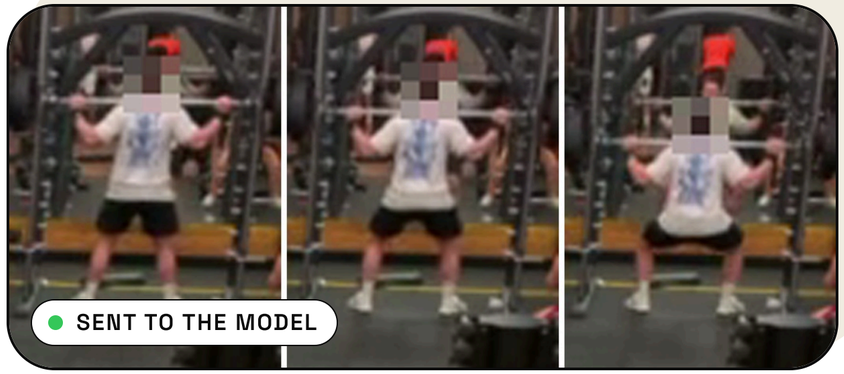

Outreach: founder-reported; no pilot agreed, no LOI, no revenue yet. Dates: git history of this repo (2026); hackathon: Berkeley × Google DeepMind, 3-hour sprint, no placement.

Why now

A vision model now names the exercise from one blurred image per set.

No rule written per exercise: the same method runs on every lift. TESTED ON SQUATS AND DIPS

→ **Squat**

smith machine
confidence 0.95

→ **Dip**

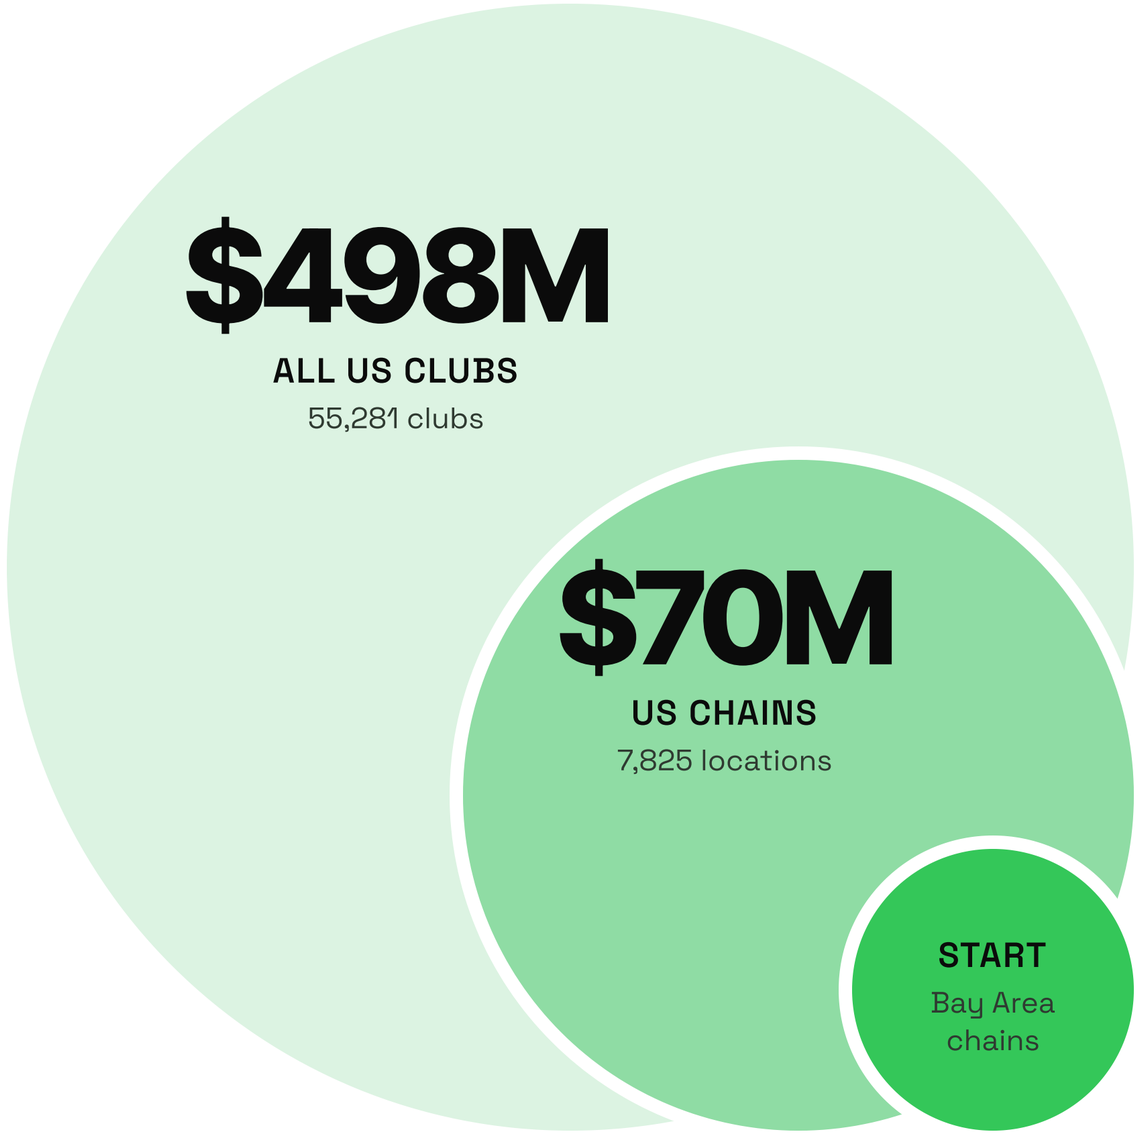

bodyweight
confidence 0.95

Real inputs and outputs from recorded clips (session.json, Gemini Flash-Lite); faces are pixelated before the call. Cost: est. $0.001–0.005 per set from list prices, token counts not yet measured. Pose: 13–14 fps on recorded clips (team-stated, not a benchmark).

Market

US gym chains alone: about $70M a year at our target price.

- ASSUMED — Half of locations have usable cameras (30–70%: $42–99M).
- HYPOTHESIS — $1,500 per location per month, untested.
- MATH — Every 100 locations ≈ $1.8M a year.

Size = locations × 50% × $18,000 a year. US clubs: HFA. US chains: vendor counts, ±5%. Global not sized until the gym count has a source. Math in appendix A4.

Business model

Gyms pay per location. Members use it free.

TARGET PRICE

$1,500

per location per month, hardware included

HYPOTHESIS · UNTESTED

ILLUSTRATIVE: PRICE UNTESTED, COSTS ASSUMED

$1,247

Gross margin, 83%

$253

Cost to serve, 17%

BREAK-EVEN

Pays for itself if a location keeps **[N]** members it would have lost.

N = $1,500 ÷ monthly dues

[TODO: dues from the chain or a public price list (NU3)]

MEMBERS

Free logging. Paid AI coach later.

HYPOTHESIS

Per location per month, 400-member gym, one box: hardware over 36 months, Gemini at the 2027 list price, payments 2.9%. Derived in CLAIMS.md; cost lines are assumptions. No customer has paid yet.

Competition

Apps need typing. Machines track only themselves. Camera tracking has no proven leader yet.

Hevy · Gravit

LOGGING APPS

Members type every set.

EGYM · Technogym

SMART MACHINES

Track only their own machines.

VPixel · Exersight

CAMERA TRACKERS

VPixel: existing cameras since 2019, no named gyms.
Exersight: its own cameras.

Spottr

EXISTING CAMERAS + ONE BOX

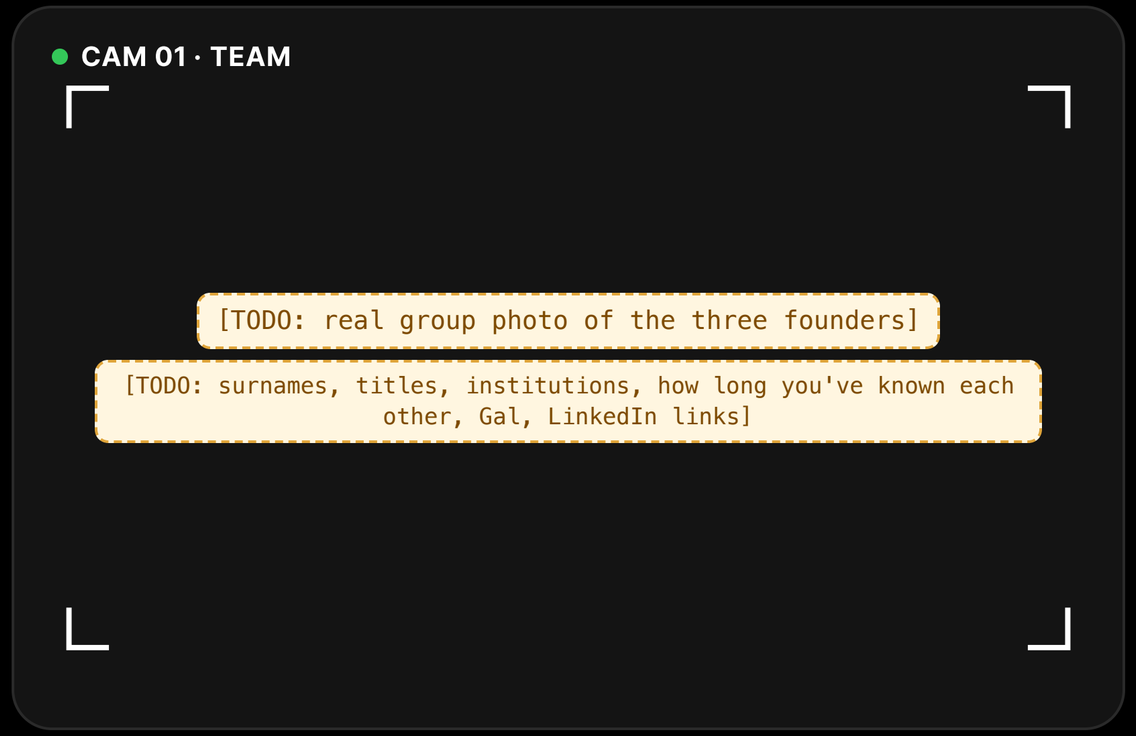

Sets and reps for members, floor data for the gym.

`[TODO: our verified edge vs VPixel (HC4)]`

Our reading of public material: VPixel (Agmis article; Health Club Management, Mar 2019), Exersight (exersight.com). Confirm Exersight is the "German startup" from v2. Whoop and GroeFit: appendix A5.

Team

Three full-time co-founders who built the product themselves.

Felix Müller-Gliemann — CO-FOUNDER · CEO

Business, LMU Munich; exchange at UC Berkeley Haas. Ex-Founders Associate at an AI-native M&A startup. Built the two-camera floor map.

Martin [surname] — CO-FOUNDER · CTO

MSc Entrepreneurship. Built the vision pipeline (pose, tracking, rep counting) and the member app.

Gard [surname] — CO-FOUNDER · CPO (TBC)

MSc Robotics. [TODO: what Gard built or owns]

Who built what: git history (authors of backend/, world-service/, src/). Titles: CLAIMS.md, to be confirmed.

The ask

$300K PRE-SEED FOR 12 MONTHS.

To go live on real gym cameras, run 5–15 pilot locations and convert the first to paid.

tryspottr.app/demo

info@tryspottr.app

PLAN, NOT COMMITMENTS

[TODO: confirm months (meeting notes: chain onboarding from 1 Nov); use-of-funds split; instrument and cap]

OCT 2026	JAN 2027	APR 2027	JUL 2027	OCT 2027
Close	Box benchmark	First live install	5–15 pilots	First paid LOI

then a seed round

Use: founder runway, pilot hardware (about $7–36K for 5–15 pilots: 5 × $1,489 to 15 × $2,388), product. Target close end of October 2026; months from the v1 plan.

APPENDIX

A1 · Privacy

We track body pose, not faces. Here is what the build does today.

AVAILABLE TODAY

- TODAY **No face recognition.** Sets and reps come from body keypoints over time.
- TODAY **Bystanders pixelated** head to toe in the member replay (when detected).
- TODAY **Blurred snapshots only:** the model gets one small image per set, lifter's face pixelated, others fully pixelated.
- TODAY **Operators see aggregates:** counts, trends, zones. No photos or video.
- TODAY **Recaps generated from text** (exercise names, reps), never video.

IN DEVELOPMENT

- BUILDING All processing on the Spottr box; goal: raw video never leaves the gym.
- BUILDING Member opt-in and opt-out.
- BUILDING Retention windows with automatic deletion.
- BUILDING Self-serve export and deletion.

KNOWN LIMIT

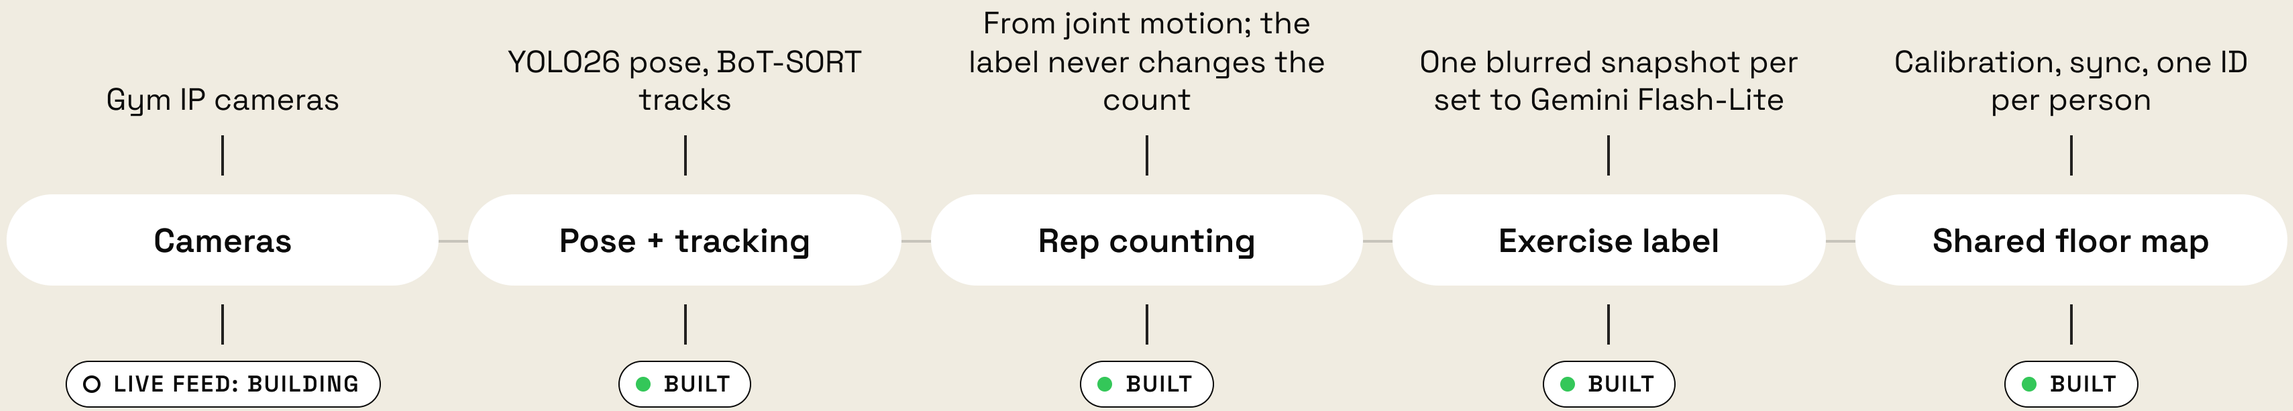

Blur covers only people the pose model detects; the replay blurs while drawing, the video file itself is not blurred.

`[TODO: GDPR / CCPA framework and consent flow, after legal review]`

Mirrors the /gyms/privacy page ("Available today" vs "In development"), which lists only what the current build does.

A2 · Technology

From camera stream to logged set, with no per-exercise rules.

TESTED ON

Recorded gym clips (squat, dip, crowd). The floor map: two phones filmed in a lounge, not a gym.

DESIGNED FOR

Gym IP cameras and one on-site box (Mac mini class) per gym; only blurred snapshots and workout data leave the building.

BUILDING

RUNS ON

Python vision pipeline · FastAPI world service · React/TypeScript member app and gym dashboard.

Rep counting is exercise-agnostic by design (backend/vision/analyze.py) and tested on squats and dips. Floor map: world-service/docs/REPORT.md.

A3 · What we have measured

Measured: identity tracking across two cameras. Not yet: rep-count accuracy at scale.

TEST	RESULT	SCOPE
Two-camera identity	IDF1 0.949 · 0 false merges	Held-out 60 s, 10 people, single reviewer
Cross-camera linking	Recall 0.70 · 21% "needs confirmation" · 11 ID switches	Same segment
Floor position	Cameras agree within 0.26 m (median), 0.72 m (p90)	Same segment; two phones in a lounge, not a gym
Rep counting	5 squats and 10 dips counted · 0 false sets on a crowd clip	3 recorded clips; team-stated, not a benchmark
Speed	13–14 fps pose + tracking	Recorded clips, team-stated
Synthetic tests	17/17 pipeline · 10/10 world service	Synthetic skeletons and scenes, not video
Next	Labelled rep-count eval: `[N] sets × [M] exercises, % reps exact`	Before YC; same review method as the floor map

Floor map: world-service/docs/REPORT.md §3 (held-out segment 420–480 s). Pipeline: CLAIMS.md, slide-7 rows; fps from session.json (13.4 and 14.2).

A4 · Market and unit economics

Locations × camera share × price. Price and camera share are assumptions.

LAYER	LOCATIONS	WITH CAMERAS (50%)	PRICE / YEAR	SIZE	SOURCE
US chains	7,825	~3,900	$18,000	$70M	Vendor counts, ±5%
US, all clubs	55,281	~27,600	$18,000	$498M	HFA
Bay Area chains	~208 (implied)	~104	$18,000	$1.9M	v1 research, assumed
Global	Not sized: no sourced global gym count yet				OPEN

COST TO SERVE, PER LOCATION PER MONTH

Gemini labels $99 · support $50 · payments $43.50 (2.9%) · hardware $41.40 (one box over 36 months) · hosting $15 · device management $4 = **$252.90**, so **83.1%** gross margin at $1,500. ASSUMED

WHAT GYMS PAY FOR SOFTWARE TODAY

Mindbody Starter $79 per location per month; Glofox €220–515 per month per plan. Camera vendors: Flock $1,500 per camera per year (2018); Density $45 per sensor per month (2016). Our $1,500 is about 19× gym software per location, so the chain pilot tests the price first.

Camera share 30–70% moves US chains to $42–99M. Costs: CLAIMS.md slide 9 (400-member gym, one box; two boxes: 81.2%). Comparators: deck/benchmark/04_analog_decks.md (pricing pages and press).

A5 · Competitors

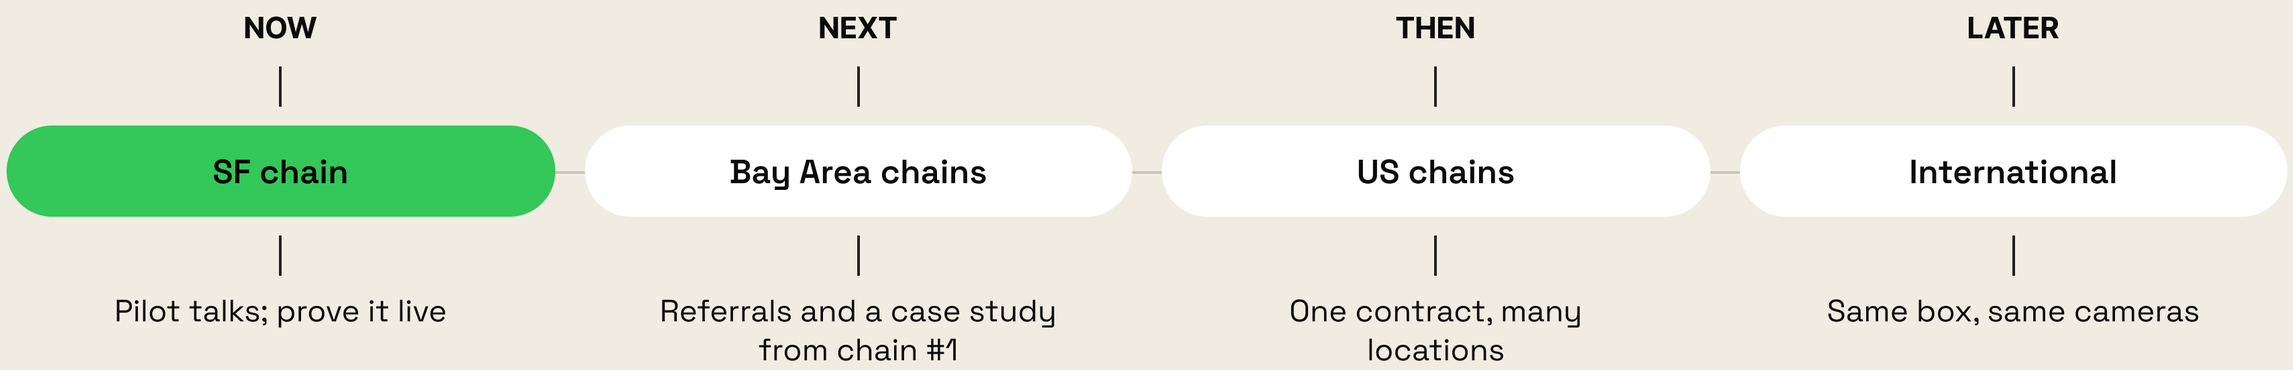

Automatic trackers bring their own hardware or show no named gyms. Spottr is designed for the cameras a gym already owns.

PLAYER	WHAT IT IS	TRACKING	HARDWARE	WHAT IT LACKS VS SPOTTR
VPixel (Agmis)	Coaching and retention from gym cameras (since 2019)	Automatic	Existing cameras	No named gyms or prices in its public material
Exersight	Camera-based form feedback, Germany (2025)	Automatic	Own cameras	New cameras per studio; one development site
EGYM, Technogym	Smart strength machines, connected equipment	Automatic	Own machines	Only their own machines
GroeFit	Occupancy and churn analytics	No set logging	Software	No sets and reps
Whoop	Wrist wearable	Strain-based	Wearable	Members wear it; strain, not sets
Hevy, Gravit	Workout logging apps	Manual	Phone	Members type every set
Spottr	Gym cameras to workout log and floor data	Automatic	Existing cameras + one box	`[TODO: verified edge vs VPixel]`

Our reading of public material (deck/benchmark/04_analog_decks.md; CLAIMS.md slide 10). Incumbents could add camera tracking.

A6 · Go-to-market

Chains first: one contract, many locations.

GYM CHANNEL

Direct founder outreach to chain operators: 20 gyms emailed, 8 replied (founder-reported).

MEMBER CHANNEL

Every partner gym brings its members in free. Premium converts from there (hypothesis).

[TODO: sales cycle length, pilot-to-paid terms, onboarding playbook per location]

A7 · Open questions

Three things to prove next: it works live, a chain pays, members stay.

Works live

Real gym cameras, several streams on one box. The first milestone after the close.

A chain pays

Pilot first, then a paid LOI at a price the chain has seen.

Members stay

No retention evidence yet. The pilots measure it.

OPEN: WHO IS WHO

Linking a person on camera to a member account. Options: QR check-in at the door · Refit ID · face recognition at entry **(needs legal review; today we do no face recognition)**.

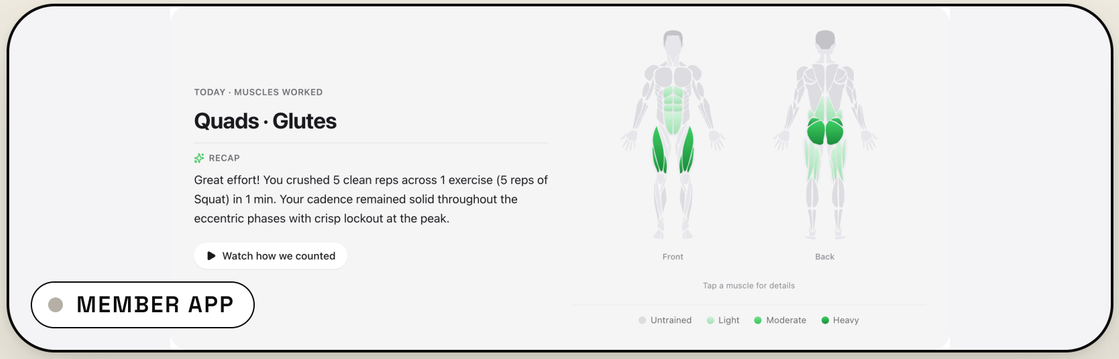

ROADMAP

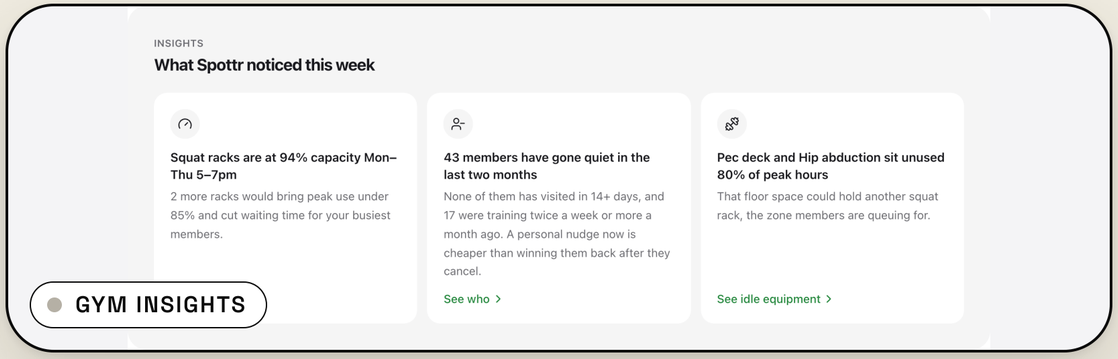

Members: AI coach, PRs, leaderboards. Gyms: live floor map, idle equipment, churn signals.

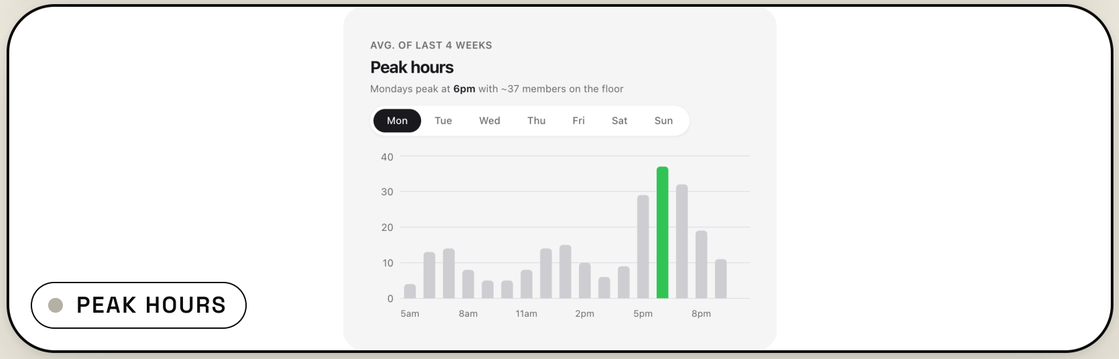

`[TODO: success thresholds the founders commit to: accuracy %, active-member share, pilot-to-paid]`

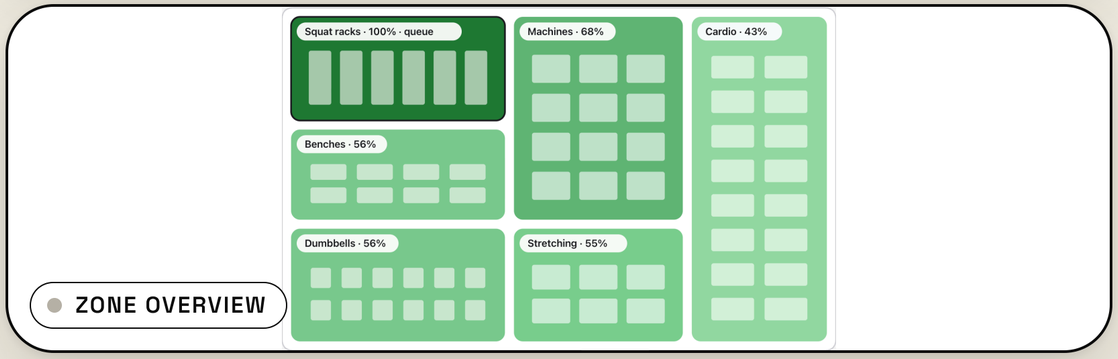

A8 · Product

The product today, shown with demo data.

Live: tryspottr.app/demo (members) and tryspottr.app/gyms (operators). Gym screens use a simulated gym.
