

spottr,

Spottr turns the cameras a gym already has into an automatic workout log.

Automatic workout tracking from existing gym cameras.

Draft, 2026

[TODO: presenter names, contact email, and which submission this is (YC W27 application vs a16z pitch)]

PROBLEM

Gyms lose about a third of members yearly; engaged members stay seven months longer.

66.4%

average annual retention

23 vs 16

months: engaged vs others

2.1 → 1.5

visits a week, 2019 to 2024

[TODO: one real quote or objection from a gym owner we spoke to]

WHY NOW

Strength is booming, gyms are healthy, and AI labelling is estimated at under a cent per set.

81M

US members, 2025

Free weights grow fastest

Revenue +10.7%, EBITDA 22.1%

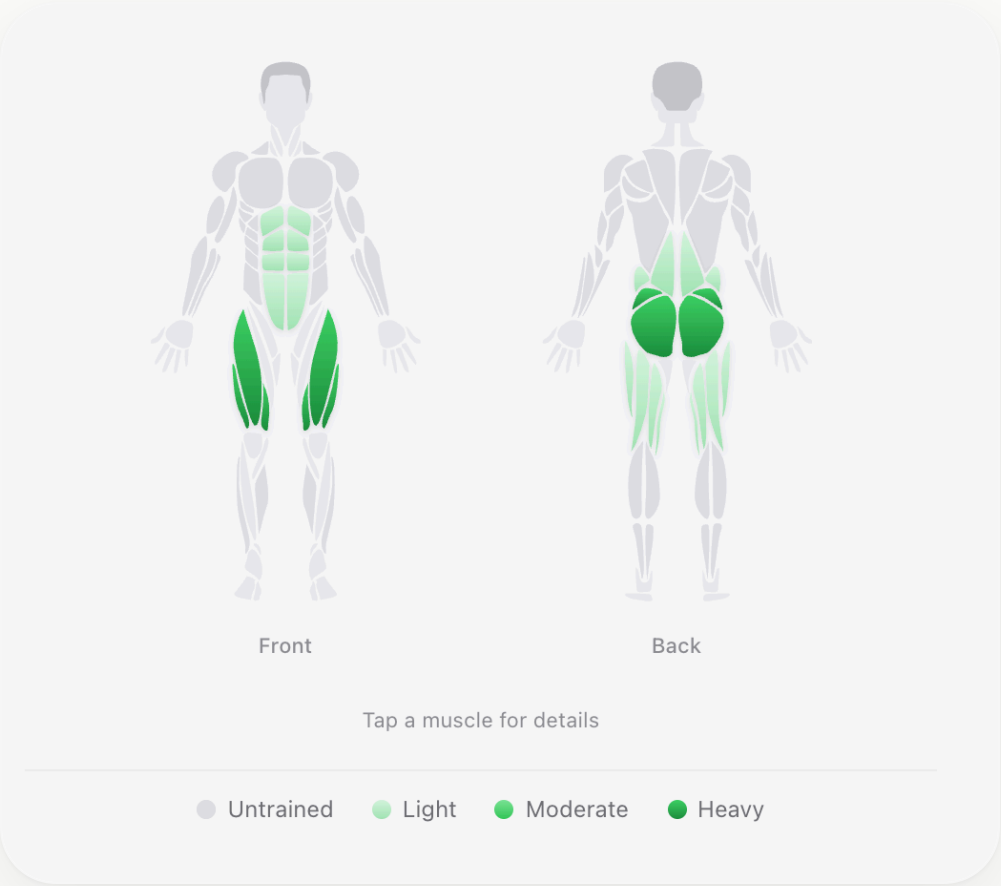

AI label ~\$0.001-0.005 (est.)

[TODO: share of mid-tier gyms with IP cameras covering the weight floor and RTSP access, add only after first site visits]

SOLUTION

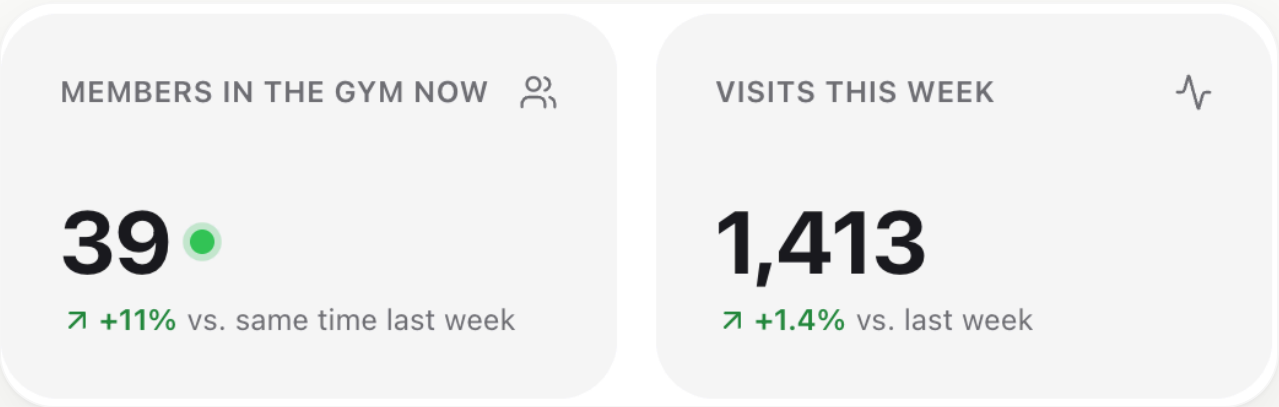

Spottr is built to log sets from a gym's existing cameras, with nothing for members to wear or type.

FOR MEMBERS

Demo data

FOR GYMS

Demo data

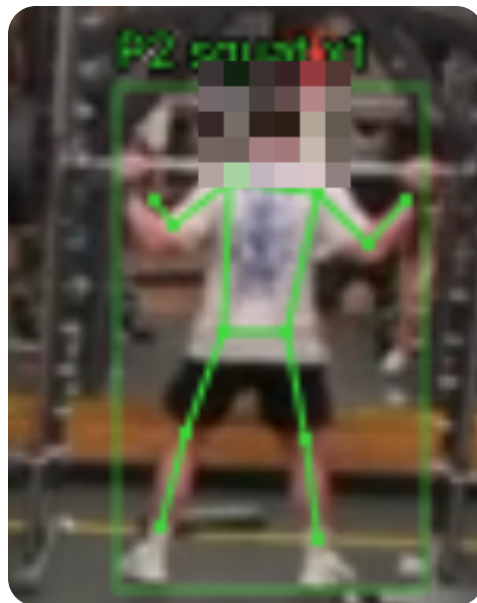

The gym pays; members use it.

[TODO: how a person on camera is linked to a member account (check-in, app QR, re-ID), unresolved]

HOW IT WORKS

Pose tracking counts reps without per-exercise rules; tested on squats and dips only.

Pose tracking

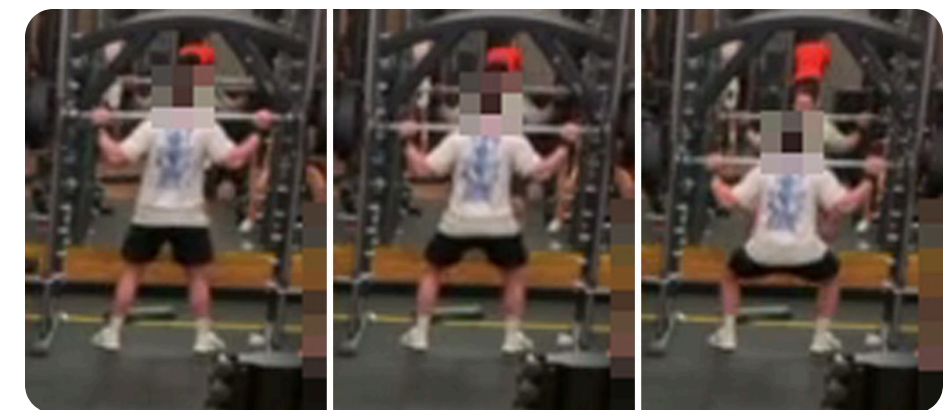

Real output, face pixelated

Rep counting

Joint motion

One blurred snapshot per set names the exercise

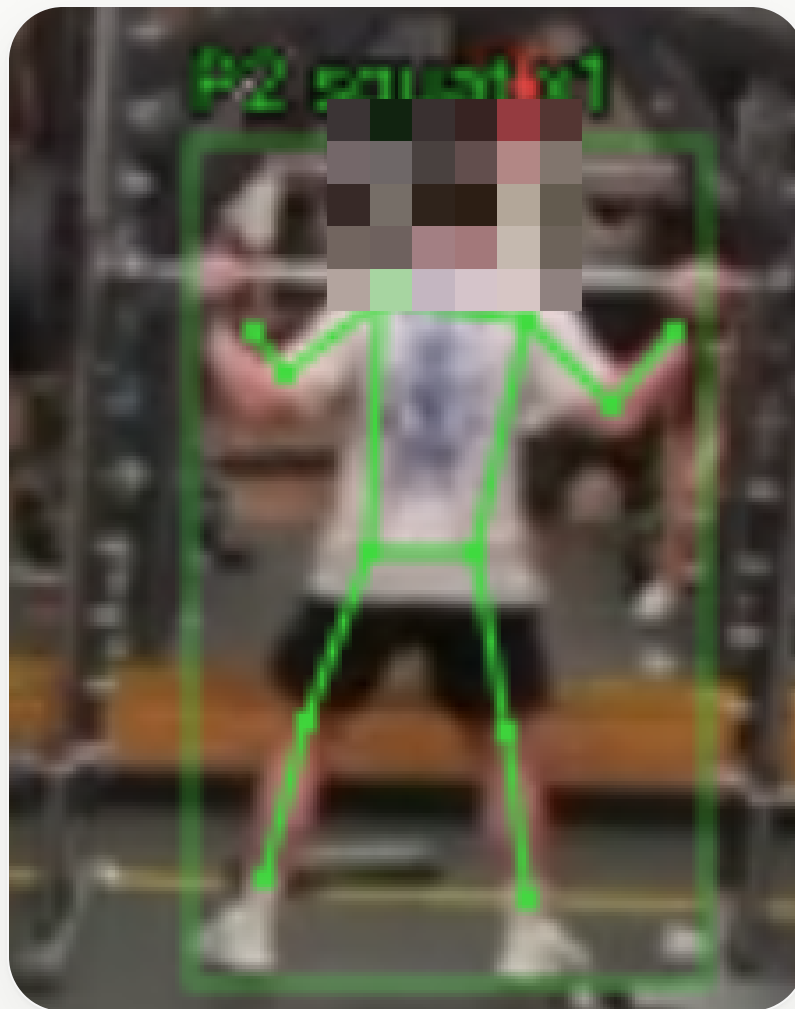

Real pipeline output

Replay pixelates detected bystanders. On-site processing is the target.

Step 2 counts reps from joint motion; the exercise label never changes the count (01_product.md §3). Not every person is guaranteed to be detected, so undetected people are not blurred. Today's Gemini snapshot is one blurred composite per set; processing on a Mac mini in the gym is the target, not deployed (01_product.md §2-§4; Privacy page).

PRODUCT

The replay shows the real pipeline: a skeleton overlay on a recorded squat.

Real output, lifter's face pixelated for this deck

REAL

Replay of a recorded clip; 5 squats counted (team-stated).

SIMULATED

Operator dashboard and most member tabs.

[TODO: confirm the lifters in squat.mp4 and dip.mp4 are team members or have consented before showing replay frames]

WHERE WE ARE

A 3-hour sprint produced a technical core that has run on recorded clips, not a live gym camera.

BUILT

17/17 synthetic tests
5 squats, 10 dips
Outreach started

NOT YET

Live cameras, pilots, LOIs, revenue

[TODO: number of gyms contacted, replies, and any camera setup seen]

[TODO: named VCs or ex-YC founders who gave positive feedback, only with their permission]

Berkeley x Google DeepMind Hackathon, 2026-09-27 (context.md); no placement. Also 0 false sets on a crowd clip; 13-14 fps on one stream. Counts are team-stated on 3 clips, not a benchmark.

MARKET

We estimate about 6,400 target US gyms, roughly \$30M a year, on stated assumptions.

55,281	US clubs
<u>~6,400 · \$30.5M</u>	assumed camera-suitable gyms (30% share, 50% camera coverage)
\$4.2M · \$0.8M	California · Bay Area

Estimate, not data

[TODO: venture-scale story beyond mid-tier gyms (chains, B2C freemium, other segments, equipment-utilisation data, international), not sized in the research; founders to choose]

BUSINESS MODEL

**Central-case gross margin is 44.6% at \$399 with one box;
about 37% with two.**

44.6%

\$399 tier, one box (central case)

37.4%

two boxes

27.1%

\$299 tier, one box

Hardware \$1,489-2,388 per gym.

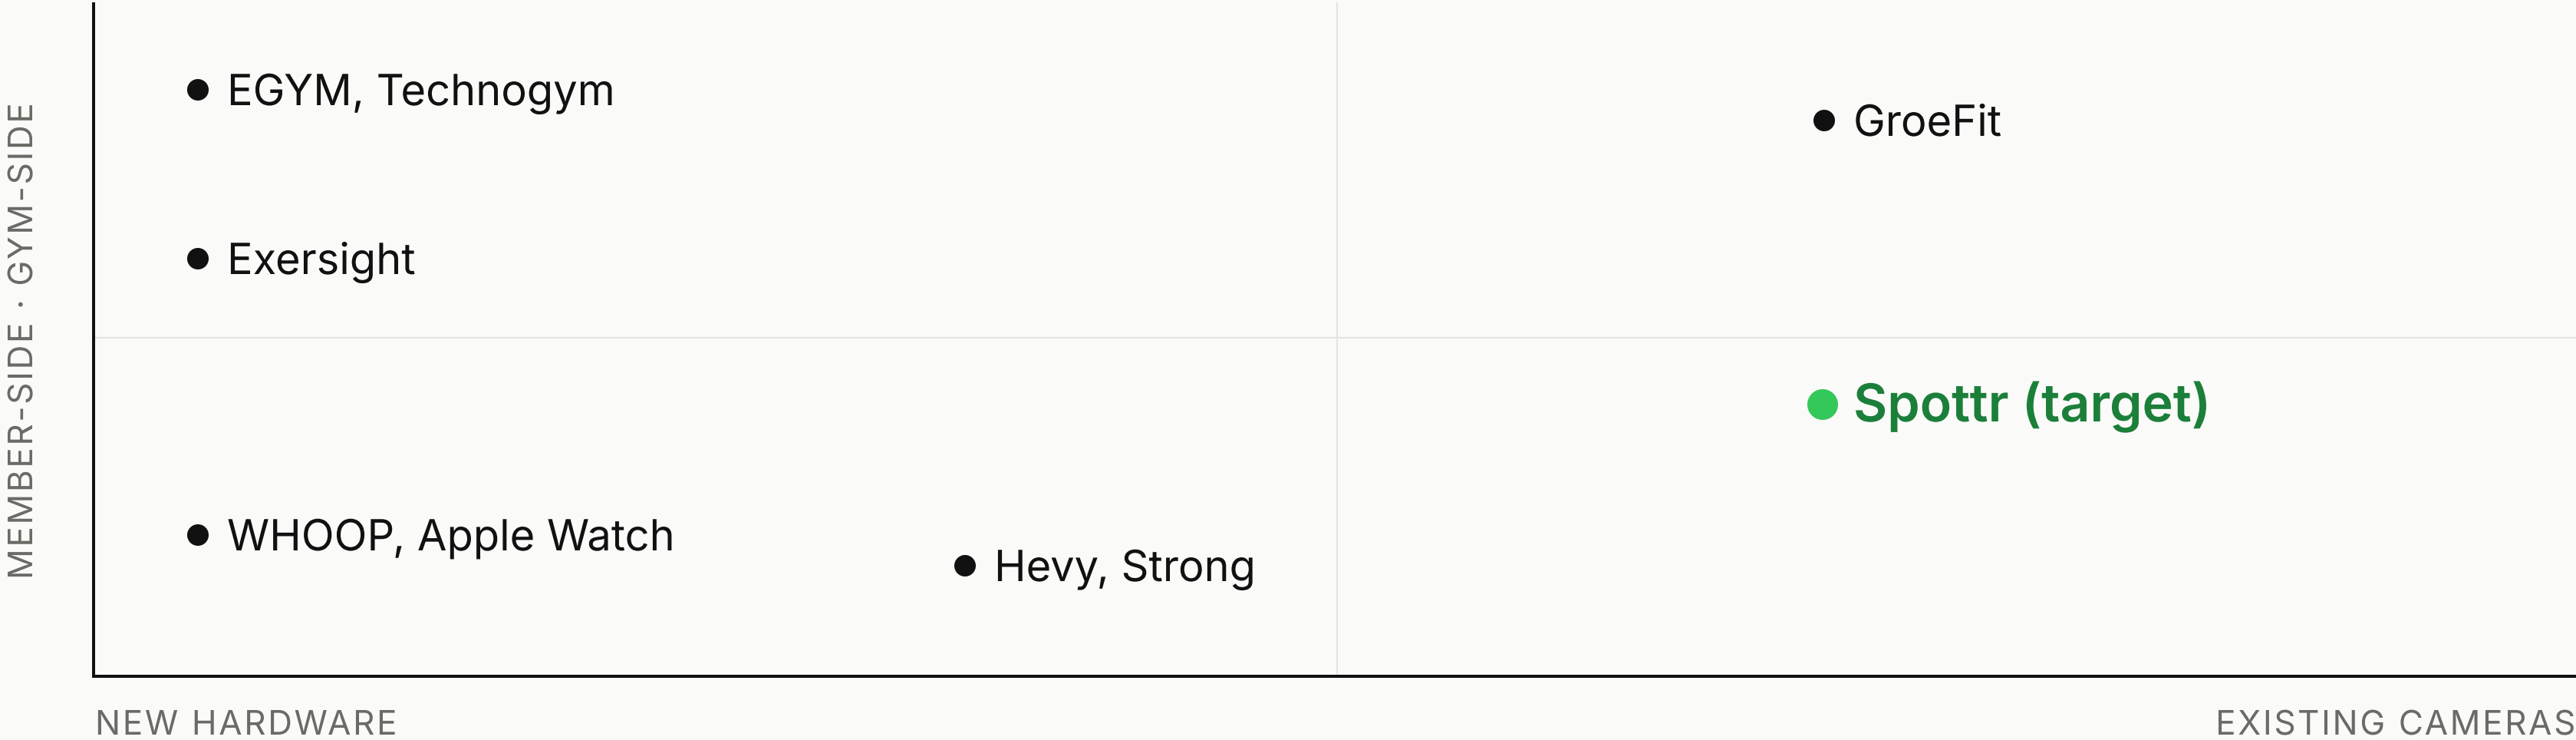

Illustrative; no customer has paid

[TODO: confirm pricing model with founders (per-location tiers \$299/\$499, hardware included, 60-day pilot to LOI)]

Per month: \$399 revenue, \$221 costs, \$178 gross profit (one box). Assumes a 400-member gym and Gemini Flash at the 2027 price; \$299 tier on Flash-Lite would be 54.2%. Hardware is carried by Spottr. Break-even: keep 5.8-9.3 members a year (retention effect unproven). 05_business_model.md §2.4, §3, §4.2.

COMPETITION

Incumbents log on their own machines, wearables need a device, and rival Exersight installs its own cameras.

[TODO: differentiation vs Exersight, what Spottr does that it does not]

04_competition.md §1, §4, §6, §8. Positions are our reading, not measured. Incumbents could add camera tracking later; the YC company directory is not yet scanned (04_competition.md §9).

TEAM

Three full-time founders with business, entrepreneurship and robotics backgrounds.

Felix Müller-Gliemann

BSc Business Administration (LMU Munich), exchange at UC Berkeley (Haas). Ex-Founders Associate, AI startup.

Frontend, sales, fundraising.

Martin

MSc Entrepreneurship.

Gard

MSc Robotics.

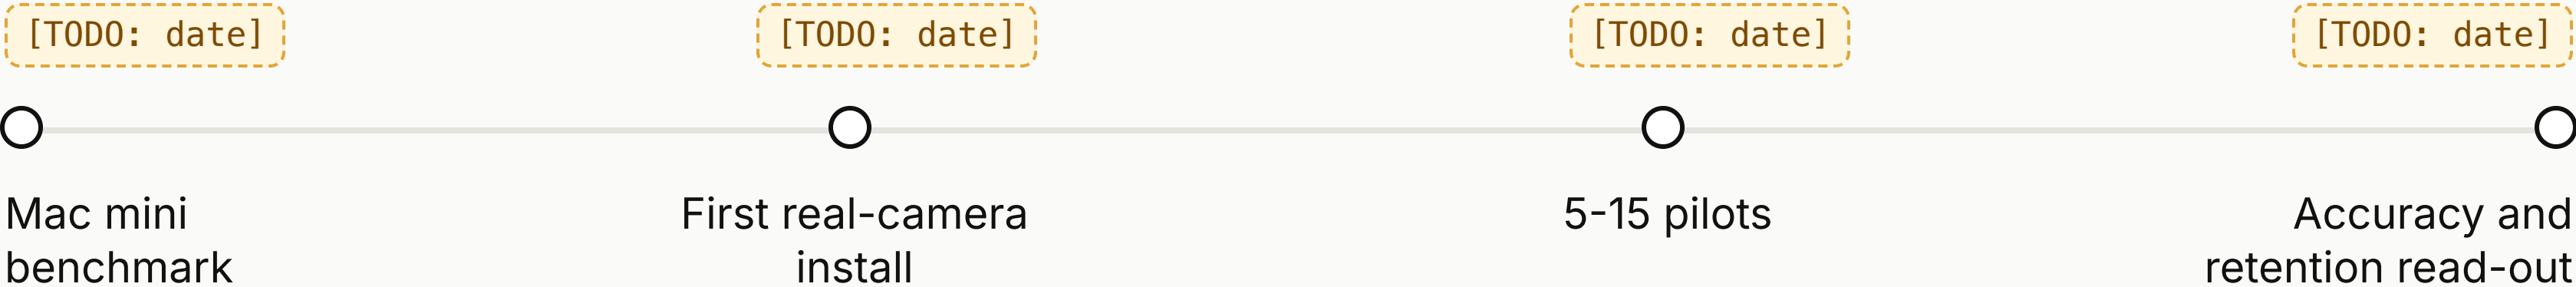

[TODO: Martin / Gard role split on the vision pipeline is open (git history conflicts), CEO / CTO titles, full names]

[TODO: US work/visa status] [TODO: incorporation plan and timing, not yet incorporated] [TODO: advisors or references]
[TODO: photos]

THE ASK

We are raising \$300k so three founders can work full-time in the US and take Spottr onto real gym cameras.

Plan, not commitments

[TODO: instrument and cap (SAFE? post-money cap?)] [TODO: how \$300k relates to YC's \$500k / the a16z program] [TODO: use-of-funds percentages] [TODO: incorporation timing]

Use of funds: runway, hardware, pilots, product (context.md). Next: a seed round after pilots (plan, 03_market.md §3.4). Hardware for 5-15 pilots about \$7k-36k (estimate: 5 x \$1,489 to 15 x \$2,388).

WHAT WE MUST PROVE

Three things must be proven: it works live, gyms pay, and tracking keeps members.

WORKS LIVE

Test on real gym cameras.

GYMS PAY

60-day pilot to a paid LOI.

RETENTION

No evidence yet; pilots measure it.

[TODO: success thresholds the founders will commit to (accuracy %, active-member share, pilot-to-paid conversion)]

Legal review of member linking and consent comes before any privacy claim. 00_summary.md §2 rows 1-3; 03_market.md §4.6; 05_business_model.md §5 (pilot design, not a benchmark); 02_problem_customer.md §7.
